

The Future of Wireless Communications

Chairman: Professor Yitzhak “Irving” Kalet

We are entering a new age of wireless communications, which will be based on terrestrial and satellite communications. This panel session brings together experts to discuss technical innovations and communication techniques that will define the vital communications elements of this new age. The topics discussed, may include 5G-6G evolution, use of milli-microwave frequencies, modulation techniques and antenna advances, energy efficiency and advances in the information theory background of some of these new developments.
